

## CS 220 Computer Architecture

### HW 07 - MIPS 2

Fall 2023

DEPARTMENT OF COMPUTER SCIENCE AND INFORMATION SYSTEMS

#### PART 0: READING

- Study the following Tutorials on MIPS Assembly Programming
  1. [Bitwise Logic with Immediate Operands](#) [This is a link]
  2. [Shift Instructions and Logic Instructions](#) [This is a link]
  3. [Memory Access Instructions](#) [This is a link]

#### PART 1: QUESTIONS ON MIPS ASSEMBLY PROGRAMMING

**Note** that, for each of the questions, copy and paste to the following table and provide your **answer** with **Justification**.

**For Example:**

#### QUESTION 0

Q0	<p>In the following instruction</p> <pre>sub  \$25, \$16, \$17</pre> <p>What register holds the result?</p> <p>A. \$25 B. \$16 C. \$17 D. \$0</p>
	<p><b>Answer:</b> A. \$25</p>
	<p><b>Justification:</b> sub \$d, \$s, \$t <math>\Rightarrow</math> \$d = \$s - \$t \$25 is the destination register.</p>

## A. QUESTIONS ON BITWISE LOGIC WITH IMMEDIATE OPERANDS

### QUESTION 1

Q1	<p>What is it called when a logical operation is performed between the bits of each column of the operands to produce a result bit for each column?</p> <ul style="list-style-type: none"> <li>A. logic operation</li> <li>B. column operation</li> <li>C. bitwise operation</li> <li>D. immediate operation</li> </ul>
	<p><b><u>Answer:</u></b> C</p>
	<p><b><u>Justification:</u></b> A bitwise operation is where a logical operation is performed on the bits of each column of the operands</p>

### QUESTION 2

Q2	<p>When an operation is performed, what is true of the operands in the ALU?</p> <ul style="list-style-type: none"> <li>A. At least one operand must be 32 bits wide.</li> <li>B. Each operand can be any size.</li> <li>C. Each operand can be any size up to 64 bits.</li> <li>D. Each operand must be 32 bits wide.</li> </ul>
	<p><b><u>Answer:</u></b> D</p>
	<p><b><u>Justification:</u></b> Because they are adding two 16 bit operations together, and they need another 16 bit operation to catch overflow</p>

### QUESTION 3

Q3	<p>What is it called with a bit pattern is copied into a register?</p> <ul style="list-style-type: none"> <li>A. The register is <b>loaded</b> with the pattern.</li> <li>B. The register is <b>stuffed</b> with a pattern.</li> <li>C. The register is <b>stored</b> with the pattern.</li> </ul>
----	--

	D. The register is <b>cached</b> with the pattern.
	<b>Answer:</b> A
	<b>Justification:</b> Copying a bit pattern into a register is usually called loading the register

## QUESTION 4

Q4	Which of the following instructions <b>sets</b> all the bits in the low order byte of register \$8 and leaves all other bits unchanged? <b>A.</b> ori \$8,\$8,0xFF <b>B.</b> ori \$8,\$0,0x00FF <b>C.</b> xori \$8,\$8,0xFF <b>D.</b> andi \$8,\$8,0xFF
	<b>Answer:</b> A
	<b>Justification:</b> The ori sets the bits in \$8, and it can't be B because you do not need to call the \$0 register

## QUESTION 5

Q5	Which of the following instructions <b>sets</b> bit 0 of register \$8 and clears all other bits? <b>A.</b> ori \$8, \$8, 0x1 <b>B.</b> ori \$8, \$0, 0x0001 <b>C.</b> andi \$8, \$0, 0x01 <b>D.</b> andi \$8, \$8, 0xFF
	<b>Answer:</b> D
	<b>Justification:</b> We set the bit again by comparing it with itself and clears all the other bits

**QUESTION 6**

Q6	<p>What is the result of performing an exclusive or of a bit pattern with itself?</p> <ul style="list-style-type: none"> <li><b>A.</b> The result is the same as the original.</li> <li><b>B.</b> The result is the reverse of the original.</li> <li><b>C.</b> The result is all zero bits.</li> <li><b>D.</b> The result is all one bits.</li> </ul>
	<b>Answer:</b> C
	<b>Justification:</b> Because the two operands are identical, only two XOR operations are involved: $0 \text{ XOR } 0 = 0$ and $1 \text{ XOR } 1 = 0$

**QUESTION 7**

Q7	<p>Do all machine instructions follow the same format?</p> <ul style="list-style-type: none"> <li><b>A.</b> No. There are several basic formats for machine instructions.</li> <li><b>B.</b> No. The format for each opcode is completely different than for any other opcode.</li> <li><b>C.</b> Yes. The only difference between machine instructions is the opcode.</li> <li><b>D.</b> Yes. The 32 bits are divided into 4 equal parts.</li> </ul>
	<b>Answer:</b> A
	<b>Justification:</b> Every processor or processor family has its own instruction set.

**QUESTION 8**

Q8	<p>When a machine instruction has an immediate operand, how many bits does that operand have?</p> <ul style="list-style-type: none"> <li><b>A.</b> 8</li> <li><b>B.</b> 16</li> </ul>
----	---

	<p>C. depends on the opcode.</p> <p>D. as many bits as needed for the data</p>
	<b>Answer:</b> B
	<b>Justification:</b> Some machine instructions use 16 of their 32 bits to hold one of the two operands. An operand that is directly encoded as part of a machine instruction is called an immediate operand.

## QUESTION 9

Q9	<p>Perform an <b>AND</b> operation between these two operands:</p> <p style="margin-left: 100px;">0110 1100</p> <p>A. 1111 B. 0101 C. 0110 D. 0100</p>
	<b>Answer:</b> D
	<b>Justification:</b> $0 \& 1 = 0$ , $1 \& 1 = 1$ , $1 \& 0 = 0$ , $0 \& 0 = 0$

## QUESTION 10

Q10	<p>Perform an <b>XOR</b> operation between these two operands:</p> <p style="margin-left: 100px;">0110 1100</p> <p>A. 1110 B. 1101 C. 1010 D. 0100</p>

	<b><u>Answer:</u></b> C
	<b><u>Justification:</u></b> $0 \& 1 = 1$ , $1 + 1 = 2$ so it defaults to 0, $1 + 0 = 1$ , $0 + 0 = 0$

## B. QUESTIONS ON SHIFT INSTRUCTIONS AND LOGIC INSTRUCTIONS

**Note:** for each of the Quiz questions, provide your answer with Justification.

### QUESTION 1

Q1	Shift left logical the following bit pattern by one position: 0011 1111  <div style="margin-left: 40px;"> <b>A.</b> 0011 1111  <b>B.</b> 0001 1111  <b>C.</b> 0111 1110  <b>D.</b> 0111 111 </div>
	<b><u>Answer:</u></b> C
	<b><u>Justification:</u></b> You drop the zero from the front, then add a zero to the LSB side to keep the amount of bits consistent

### QUESTION 2

Q2	Shift left logical the following bit pattern by two positions: 0011 1111  <div style="margin-left: 40px;"> <b>A.</b> 0001 1111  <b>B.</b> 1111 1100  <b>C.</b> 1111 1111  <b>D.</b> 0111 1110 </div>
	<b><u>Answer:</u></b> B
	<b><u>Justification:</u></b> You drop both zeros as you shift the two out, then add two new zeros to the rightmost point

## QUESTION 3

Q3	<p>Here is a program that loads register \$5 with a bit pattern. Complete the program so the pattern in register \$5 shifted left logical by 4 positions.</p> <pre>ori    \$5, \$0, 0x900F    # put a bit pattern into register \$5 sll    __, __, __         # shift left logical by four, put                         # pattern remains in register \$5</pre> <p>A. sll \$5, \$5, \$4  B. sll \$4, \$5, \$5  C. sll \$5, \$0, 4  D. sll \$5, \$5, 4</p>
	<b>Answer:</b> D
	<b>Justification:</b> The operation takes register 5, tells to put the result in register 5, then shifts the program by 4

## QUESTION 4

Q4	<p>Which of the following instructions has the effect of multiplying the unsigned integer represented by the bits in register eight by sixteen?</p> <p>A. sll \$8, \$0, 16  B. sll \$8, \$8, 4  C. sll \$8, \$8, 2  D. sll 4, \$8, \$8</p>
	<b>Answer:</b> B
	<b>Justification:</b> $2^4 = 16$ , and you place the exponent on the right

## QUESTION 5

Q5	<p>Which of the following instructions has the effect of dividing the unsigned integer represented by the bits in register eight by sixteen?</p> <p>A. sll \$8, \$0, 16  B. srl \$8, \$8, 4  C. sll \$8, \$8, 2</p>
----	---

	D. srl 4, \$8, \$8
	<b>Answer:</b> B
	<b>Justification:</b> $2^4 = 16$ , and you place the exponent to the right

## QUESTION 6

Q6	Write the assembly language statement that will reverse the values of each bit in register \$5 and put the result in register \$8. <b>A.</b> nori \$8,\$5,\$0 <b>B.</b> nor \$8,\$5,\$0 <b>C.</b> xor \$8,\$5,\$0 <b>D.</b> nor \$5,\$8,\$0
	<b>Answer:</b> B
	<b>Justification:</b> The collection register always goes on the right, and nor reverses the values in the register

## QUESTION 7

Q7	Write the assembly language statement that will reverse the values of each bit in register \$7 and put the result in register \$12. <b>A.</b> or \$7,\$0,\$12 <b>B.</b> nor \$7,\$7,\$12 <b>C.</b> not \$7,\$7,\$12 <b>D.</b> nor \$12,\$7,\$0
	<b>Answer:</b> C
	<b>Justification:</b> not will reverse each bit in register \$7 after taking both in and deposit it in \$12

**QUESTION 8**

Q 8	<p>Write the assembly language statement that computes the bit-wise OR between \$7 and \$8 puts the result in register \$9.</p> <p><b>A.</b> or \$9,\$8,\$7  <b>B.</b> or \$7,\$8,\$9  <b>C.</b> or \$0,\$8,\$7  <b>D.</b> or \$8,\$9,\$7</p>
	<p><b>Answer:</b> A</p>
	<p><b>Justification:</b> The operation gets register \$9 and then computes \$8 and \$7, then puts the result into \$9</p>

**QUESTION 9**

Q9	<p>Write the assembly language statement that computes the bit-wise XOR between \$7 and \$8 puts the result in register \$9.</p> <p><b>A.</b> xori \$9,\$8,0x7  <b>B.</b> xor \$7,\$8,\$9  <b>C.</b> xor \$9,\$8,\$7  <b>D.</b> xor \$8,\$9,\$7</p>
	<p><b>Answer:</b> C</p>
	<p><b>Justification:</b> You declare the incoming register first, then the calculation comparing \$8 and \$7 are run</p>

**QUESTION 10**

Q10	<p>Write the assembly language instruction that copies the bit pattern in register \$13 to register \$15.</p> <p><b>A.</b> ori \$15,\$13,\$0  <b>B.</b> or \$15,\$13,\$0  <b>C.</b> or \$15,\$13,\$15</p>
-----	---

	<b>D.</b> xor \$15,\$13,\$13
	<b>Answer:</b> A
	<b>Justification:</b> The \$0 address is just a placeholder, and the copy statement is placed to the left

### C. QUESTIONS ON MEMORY ACCESS INSTRUCTIONS

1. How many addresses does MIPS main storage have?

Up to 32 address lines

2. What is the name of the operation that copies data from main memory into a register?

The store operation

3. Which of the following addresses are word-aligned? Justify your answer.

0x000AE430 Y

0x00014433 N

0x000B0737 N

0x0E0D8848 Y

The first and the last addresses both end in a multiple of four. The middle two do not. If the rightmost two (or more) bit positions are zero, the integer is a multiple of four.

4. Here is a bit pattern, with the most significant bits written on the left (as is usual in print): 0xFFBBAACC. Copy the bytes to memory using big-endian and little-endian orders:

Little Endian		Big Endian	
Address	Contents	Address	Contents
4003	FF	4003	CC
4002	BB	4002	AA
4001	AA	4001	BB
4000	CC	4000	FF

5. Write the instruction that loads the word at address 0x00400080 into register \$8. Assume that the register \$10 contains **0x00400000**.

`lw $8, 0x80($10)`

Hints: Here is the load word instruction in assembly language:

```
lw d,off(b)      # $d <-- Word from memory address b+off
                  # b is a register. off is 16-bit two's complement.
```

At execution time two things happen: (1) an address is calculated using the base register b and the offset off, and (2) data is fetched from memory at that address.

6. Given memory and registers \$12 and \$13 as below.

A. Write the instruction that puts the value **0x00000002** into register \$12.

`lw $12,0x8($13)`

B. Write the instruction that puts the value **0x00000004** into register \$12.

`lw $12,0x10($13)`

Register \$12 contains 0xFFFFFFFF Register \$13 contains 0x00040000	<table> <tr> <th>Memory</th><th>Addresses</th></tr> <tr> <td>00000005</td><td>00040014</td></tr> <tr> <td>00000004</td><td>00040010</td></tr> <tr> <td>00000003</td><td>0004000C</td></tr> <tr> <td>00000002</td><td>00040008</td></tr> <tr> <td>00000001</td><td>00040004</td></tr> <tr> <td>00000000</td><td>00040000</td></tr> </table>	Memory	Addresses	00000005	00040014	00000004	00040010	00000003	0004000C	00000002	00040008	00000001	00040004	00000000	00040000
Memory	Addresses														
00000005	00040014														
00000004	00040010														
00000003	0004000C														
00000002	00040008														
00000001	00040004														
00000000	00040000														

7. Given registers \$12 and \$13 and memory.

A. Write the instruction that puts the word **0xFFFFFFFF** into memory location **0x00040010**.

`sw $12,-4($13)`

B. Write the instruction that puts the word **0xFFFFFFFF** into memory location **0x0004000C**.

`sw $12,-8($13)`

C. Write the instruction that puts the word **0xFFFFFFFF** into memory location **0x00040004**.

`sw $12,-20 ($13)`

Hint: it is OK to specify the 16-bit offset as a signed decimal integer.

Register \$12 contains 0xFFFFFFFF Register \$13 contains 0x00040014	<table><tr><th>Memory</th><th>Addresses</th></tr><tr><td>00000005</td><td>00040014</td></tr><tr><td>00000004</td><td>00040010</td></tr><tr><td>00000003</td><td>0004000C</td></tr><tr><td>00000002</td><td>00040008</td></tr><tr><td>00000001</td><td>00040004</td></tr><tr><td>00000000</td><td>00040000</td></tr></table>	Memory	Addresses	00000005	00040014	00000004	00040010	00000003	0004000C	00000002	00040008	00000001	00040004	00000000	00040000
Memory	Addresses														
00000005	00040014														
00000004	00040010														
00000003	0004000C														
00000002	00040008														
00000001	00040004														
00000000	00040000
